February 8, 2016

To Whom It May Concern:

Apex Spectral' "ADF®" DHI seismic technology, which measures naturally occurring dispersion in seismic data to indicate reservoir permeability, thickness, and hydrocarbon charge was applied to several fields in South Louisiana in a series of blind tests.

Using only mid to late 1990s legacy seismic data as input, ADF® impressively imaged remnants of the depleted Mystic Bayou, Duck Lake, East Lake Verret, Oakley, and NW Oakley fields. ADF® also impressively imaged the virgin western flank extension to the East Lake Verret field drilled by SW Energy in 2000, and the virgin Willow Cove field, a 2 million barrel plus oil field discovered by Helis Oil and Gas in 2005.

Sincerely,

Lane M. Kincannon
President
